While browsing on mobile apps online continue to be gaining a momentum, the rate of shopping cart abandonment on mobile are high – and it is all because of a phenomenon called 'emotional ambivalence.'

The fear of missing out on a good deal and concerns over privacy lead people to put items on hold, but then quit without paying, with 60% of US online shoppers reporting that they abandon an order solely due to the 'costs being too high.' Some 37% say they do so because they are being asked to 'create an account'. So finds research by Baymard, based on 37 studies containing abandonment statistics calculated an average value of e-commerce shopping cart abandonment.

But it isn't all bad news. Emotional ambivalence amplifies consumers' hesitations at the checkout stage, leading to cart abandonment. However, if hesitant customers are satisfied with the choice process during their shopping, they are less likely to give up their shopping carts.
