Research. Huang, G.H., Korfiatis, N. and Chang, C.T. (2018). Mobile Shopping Cart Abandonment: The roles of Conflicts, Ambivalence, and Hesitation. *Journal of Business Research*, 85, 165-174.

Cart abandonment is a reality for online shopping. Just as it is easy to purchase, so it is easy to leave without completing a purchase. A recent study has found that cart abandonment is more likely to happen when people are using smart phones and tablets.

The study was made by the University of East Anglia and published on the Journal of Business Research. The research has shown that whilst there is a lot of online traffic coming from smart phones and tablets (As much as 46 percent of eCommerce traffic came from them in Q2 2016). Only about 27 percent then complete their purchases.

Mobile Cart Abandonment

There are some likely reasons why this is happening. One reason cited is that shoppers couldn't see the whole image of the product on smart phones, so couldn't decide whether the product looks good or not. Another reason is more about privacy and security.

> "This is a phenomenon that has not been well researched, yet it represents a huge opportunity for retailers," **Flora Huang, Lead Researcher of the Project**
